

Old string formate:

```
name ="john"  
print("Hello,%s!"% name)
```

output:

Hello,john!

```
name="John"  
age=23  
print("%s is %d year old."%(name,age))
```

output:

Hello,john!

John is 23 year old.

New string formate:

```
name="john"  
age=23  
print(" My name is {} and I am{} years old.".format(name,age))
```

output:

Hello,john!

John is 23 year old.

My name is john and I am23 years old.

Python string format():

```
txt1 ="My name is{fname},I'm{age}".format(fname="John",age=36)  
txt2 ="My name is {0},I'm{1}".format("John",36)  
txt3 ="My name is {},I'm{}".format("John",36)
```

```
print(txt1)
print(txt2)
print(txt3)
str="Java"
str2="C"
str3="{ } and { } both are programming languages".format(str,str2)
print(str3)
```

output:

Hello,john!

John is 23 year old.

My name is john and I am23 years old.

My name isJohn,I'm36

My name is John,I'm36

My name is John,I'm36

Java and C both are programming languages
